RECEIVED : 22 January, 2014

REVISED : 28 March, 2014

In this paper we have extended the result of Sayyed[10]. The purpose of this paper to further demonstrate the effectiveness of the compatible map concept as a mean of multivalued and single valued maps satisfying a contractive type condition.

KEYWORDS AND PHRASES: Hausdorff metric, Multivalued mappings, compatible mapping, complete metric space and coincidence point.

AMS (2010) subject classifications: primary 54H25; Secondary 47H10

INTRODUCTION

Banach obtained a fixed point theorem for contraction mapping, appearance of the celebrated Banach contraction principle, several generalizations of this theorem in the setting of point mappings have been obtained. Nadler [7] was the first to extend Banach contraction principle to multivalued contracting mapping.

Rhoades [9] gave a complete and comparison of various definitions of contraction mapping and also survey of the subject. The result is a generalized concept of commuting and compatible mappings under some conditions and corresponding result of Beg and Azam [1], Jungck [3, 4], Kaneko [5] Nadler [7], Reich [8], Sayyed, *et.al* [11] and many others. In this direction Faset, *et. al.* [2] proved a fixed point theory for multivalued generalized non expansive mappings. Recently Lateef *et al.* [6], Yadad *et al.* [13] and Wang and Song [12] proved a fixed point theorem for multivalued maps.

PRELIMINARIES

Let (X, d) be a metric space and let $CB(X)$ denote the family of all non-empty bounded closed subsets of X . For $A, B \in CB(X)$, let $H(A, B)$ denote the distance between A and B in Hausdorff metric, that is

$$H(A, B) = \inf E_{AB}$$

where

$$E_{AB} = \{\varepsilon > 0: A \subset N(\varepsilon, B), B \subset N(\varepsilon, A)\}$$

$$N(\varepsilon, A) = \{x: d(x, A) < \varepsilon\}.$$

A point x is said to be a fixed point of a single valued mapping $f: X \rightarrow X$ (multivalued mapping $T: X \rightarrow CB(X)$) provided $x = fx$ ($x \in Tx$). The point x is called coincidence point of f and T , if $fx \in Tx$. If each element of X is a coincidence point of f and T , then f is called a selection of T .

Let $T: X \rightarrow CB(X)$ be a mapping, then $C_T = \{f: X \rightarrow X: TX \subset fX \text{ and } (\forall x \in X) (fTx = Tfx)\}$. T and f are said to be commuting mappings if for each $x \in X$, $f(Tx) = fTx = Tfx = T(fx)$.

Lemma 2.1: {Beg [1, Lemma 2.1]}. Let S, T be two multivalued mappings of X into $CB(X)$. Let $x_0, x_1 \in X$. Then for each $y \in T(x_1)$ one has $d(y, Sx_0) \leq H(Tx_1, Sx_0)$.

Theorem 2.2: Let S, T be two mappings from a complete metric space X into $CB(X)$ and let $f \in C_S \cap C_T$ be continuous mapping. Suppose that for all $x, y \in X$,

$$\begin{aligned} [H(Sx, Ty)]^2 &\leq \alpha[d(fx, Sx)d(fy, Ty) + d(fx, Ty)d(fy, Sx)] \\ &\quad + \beta[d(fx, Sx)d(fy, Sx) + d(fy, Ty)d(fx, Ty)] \\ &\quad + \gamma d(fx, fy)H(Sx, Ty) \end{aligned} \quad \dots(1)$$

where $\alpha, \beta, \gamma \geq 0$ and $0 \leq \alpha + 2\beta + \gamma < 1$. Then there exists a common coincidence point of f and T and f and S .

Proof: Define $M = \frac{\alpha + \beta + \gamma}{1 - \beta}$. Let x_0 be an arbitrary, but fixed element of X . We shall construct two sequences $\{x_n\}$ and $\{y_n\}$ as follows.

Let $x_1 \in X$ be such that $y_1 = fx_1 \in Sx_0$, using the definition of Hausdorff metric and fact that $Tx \subset fx$, we may choose $x_2 \in X$ such that $y_2 = fx_2 \in Tx_1$ and $d(y_1, y_2) = d(fx_1, fx_2) \leq H(Sx_0, Tx_1) + (\alpha + \beta + \gamma)$.

Since $S(X) \subset f(X)$, we may choose $x_3 \in X$ such that $y_3 = fx_3 \in Sx_2$ and $d(y_2, y_3) = d(fx_2, fx_3) \leq H(Tx_1, Sx_2) + \frac{(\alpha + \beta + \gamma)^2}{1 - \beta}$.

By induction, we produce two sequence of points of X such that

$$\begin{aligned} y_{2k+1} &= fx_{2k+1} \in Sx_{2k}, \\ y_{2k+2} &= fx_{2k+2} \in Tx_{2k+1}, \end{aligned} \quad \dots(2)$$

where k is any positive integer. Further more

$$\begin{aligned} d(y_{2k+1}, y_{2k+2}) &= d(fx_{2k+1}, fx_{2k+2}) \\ &\leq H(Sx_{2k}, Tx_{2k+1}) + \frac{(\alpha + \beta + \gamma)^{2k+1}}{(1-\beta)^{2k}} \\ d(y_{2k+2}, y_{2k+3}) &= d(fx_{2k+2}, fx_{2k+3}) \\ &\leq H(Tx_{2k+1}, Sx_{2k+2}) + \frac{(\alpha + \beta + \gamma)^{2k+2}}{(1-\beta)^{2k+1}} \end{aligned}$$

Hence

$$\begin{aligned} [d(fx_{2k+1}, fx_{2k+2})]^2 &< \alpha[d(fx_{2k}, Sx_{2k})d(fx_{2k+1}, Tx_{2k+1}) \\ &\quad + d(fx_{2k}, Tx_{2k+1})d(fx_{2k+1}, Sx_{2k})] \\ &\quad + \beta[d(fx_{2k}, Sx_{2k})d(fx_{2k+1}, Sx_{2k}) \\ &\quad + d(fx_{2k+1}, Tx_{2k+1})d(fx_{2k}, Tx_{2k+1})] \\ &\quad + \gamma d(fx_{2k}, fx_{2k+1})d(fx_{2k+1}, fx_{2k+2}) + \frac{(\alpha + \beta + \gamma)^{2k+1}}{(1-\beta)^{2k}} \\ d(fx_{2k+1}, fx_{2k+2}) &< (\alpha + \beta + \gamma)d(fx_{2k}, fx_{2k+1}) + \beta d(fx_{2k+1}, fx_{2k+2}) \\ &\quad + \frac{(\alpha + \beta + \gamma)^{2k+1}}{(1-\beta)^{2k}} \\ d(fx_{2k+1}, fx_{2k+2}) &\leq \frac{(\alpha + \beta + \gamma)}{(1-\beta)}d(fx_{2k}, fx_{2k+1}) + \frac{(\alpha + \beta + \gamma)^{2k+1}}{(1-\beta)^{2k+1}} \\ d(fx_{2k+1}, fx_{2k+2}) &\leq Md(fx_{2k}, fx_{2k+1}) + M^{2k+1} \end{aligned}$$

$$\text{Similarly, } d(fx_{2k}, fx_{2k+1}) \leq Hd(Tx_{2k}, Sx_{2k}) + \frac{(\alpha + \beta + \gamma)^{2k}}{(1-\beta)^{2k-1}}$$

$$\text{Therefore, } d(fx_{2k}, fx_{2k+1}) \leq Md(fx_{2k-1}, fx_{2k}) + M^{2k}$$

It further implies that

$$\begin{aligned} d(y_n, y_{n+1}) &\leq Md(y_{n-1}, y_n) + M^n \\ &\leq M^{n-1}d(y_1, y_2) + (n-1)M^n \\ &\leq M^{n-1}d(fx_1, fx_2) + (n-1)M^n \end{aligned}$$

for $p \geq 1$, we have

$$\begin{aligned} d(y_{n+1}, y_{n+p+1}) &\leq d(y_{n+1}, y_{n+2}) + d(y_{n+2}, y_{n+3}) + \dots + d(y_{n+p}, y_{n+p+1}) \\ &\leq \{M^n d(fx_1, fx_2) + nM^{n+1}\} \end{aligned}$$

$$\begin{aligned}
& + \{M^{n+1}d(fx_1, fx_2) + (n+1)M^{n+2}\} + \dots \\
& + \{M^{n+p-1}d(fx_1, fx_2) + (n+p-1)M^{n+p}\} \\
& \leq \sum_{i=1}^{n+p-1} M^i d(fx_1, fx_2) + \sum_{i=n}^{n+p-1} iM^{i+1}
\end{aligned}$$

It follows that the sequence $\{y_n\}$ is Cauchy sequence. Hence there exists z in X such that $y_n \rightarrow z$. Therefore $fx_{2k+1} \rightarrow z$ and $fx_{2k+2} \rightarrow z$. From (2), we have

$$f^2x_{2k+1} = ffx_{2k+1} \in fSx_{2k} \subset Sfx_{2k},$$

and $f^2x_{2k+2} = ffx_{2k+2} \in fTx_{2k+1} \subset Tfx_{2k+1}$.

Now using lemma 2.1

$$\begin{aligned}
[d(fz, Sz)]^2 & \leq [d(fz, f^2x_{2k+2}) + d(f^2x_{2k+2}, Sz)]^2 \\
& \leq [d(fz, f^2x_{2k+2}) + H(Tfx_{2k+1}, Sz)]^2 \\
& = [d(fz, f^2x_{2k+2})]^2 + 2H(Tfx_{2k+1}, Sz)d(fz, f^2x_{2k+2}) \\
& \quad + [H(Tfx_{2k+1}, Sz)]^2 \\
& \leq [d(fz, f^2x_{2k+2})]^2 + 2H(Tfx_{2k+1}, Sz)d(fz, f^2x_{2k+2}) \\
& \quad + \alpha[d(fz, Sz)d(f^2x_{2k+1}, Tfx_{2k+1}) + d(fz, Tfx_{2k+1}) \\
& \quad \quad d(f^2x_{2k+1}, Sz)] + \beta[d(fz, Sz)d(f^2x_{2k+1}, Sz) \\
& \quad \quad + d(f^2x_{2k+1}, Tfx_{2k+1})d(fz, Tfx_{2k+1})] \\
& \quad + \upsilon d(fz, f^2x_{2k+1})H(Tfx_{2k+1}, Sz) \\
& \leq [d(fz, f^2x_{2k+2})]^2 + 2H(Tfx_{2k+1}, Sz)d(fz, f^2x_{2k+2}) \\
& \quad + \alpha[d(fz, Sz)d(f^2x_{2k+1}, f^2x_{2k+2}) + d(fz, f^2x_{2k+2}) \\
& \quad \quad d(f^2x_{2k+1}, Sz)] + \beta[d(fz, Sz)d(f^2x_{2k+1}, Sz) \\
& \quad \quad + d(f^2x_{2k+1}, f^2x_{2k+2})d(fz, f^2x_{2k+2})] \\
& \quad + \gamma d(fz, f^2x_{2k+1})d(f^2x_{2k+2}, Sz)
\end{aligned}$$

Since f is continuous, by letting $K \rightarrow \infty$, we obtain

$$[d(fz, Sz)]^2 \leq \beta[d(fz, Sz)]^2$$

or $d(fz, Sz) \leq \sqrt{\beta}d(fz, Sz)$.

Thus $fz \in Sz$. Similarly,

$$\begin{aligned}
[d(fz, Tz)]^2 &\leq [d(fz, f^2x_{2k+1}) + d(f^2x_{2k+1}, Tz)]^2 \\
&\leq [d(fz, f^2x_{2k+1}) + H(Sfx_{2k}, Tz)]^2 \\
&\leq \beta [d(fz, Sz)]^2
\end{aligned}$$

Therefore $fz \in Tz$. Hence Z is a coincidence point of f and S and f and T .

Corollary 2.3: Let S, T be continuous mappings from a complete metric space X into $CB(X)$ and $f \in C_S \cap C_T$ be a continuous mapping. Assume that (1) is satisfied. If $f(z) \in Sz \cap Tz$ implies $\lim_{n \rightarrow \infty} f^n z = t$, then t is a common fixed point of S, T and f .

Proof: Clearly, $fx \in Sz$ implies that $f^2z \in fSz \subset Sfx$. Therefore $f^{n+1}z \in Sf^nZ$. It follows that $t \in St$. Similarly $t \in Tt$. Moreover,

$$ft = f \lim_{n \rightarrow \infty} f^n z = \lim_{n \rightarrow \infty} f^{n+1} z = t.$$

Hence t is a common fixed point of f, S and T .

In the following theorem the continuity of f and its commutativity with S and T are not required.

Theorem 2.4: Let S, T be two mappings from a metric space X into $CB(X)$ and let $f: X \rightarrow X$ be a mapping such that $f(X)$ is complete, $T(X) \subset f(X)$ and $S(X) \subset f(X)$. Suppose that (1) is satisfied, then there exists a common coincidence point of f and T and f and S .

Proof: As in the proof of theorem 2.2 we construct the Cauchy sequence $y_n = fx_n \in X$. By our hypothesis it follows that there exists a point u in X such that $y_n \rightarrow z = fu$. Now using Lemma 2.1, we have

$$\begin{aligned}
[d(fu, Tu)]^2 &\leq [d(fu, fx_{2k+1}) + d(fx_{2k+1}, Tu)]^2 \\
&\leq [d(fu, fx_{2k+1}) + H(Sx_{2k}, Tu)]^2 \\
&\leq [d(fu, fx_{2k+1})]^2 + 2H(Sx_{2k}, Tu)d(fu, fx_{2k+1}) \\
&\quad + [H(Sx_{2k}, Tu)]^2 \\
&\leq [d(fu, fx_{2k+1})]^2 + 2d(fu, fx_{2k+1})H(Sx_{2k}, Tu) \\
&\quad + \alpha[d(fx_{2k}, Sx_{2k})d(fu, Tu) + d(fx_{2k}, Tu) d(fu, Sx_{2k})] \\
&\quad + \beta[d(fx_{2k}, Sx_{2k})d(fu, Sx_{2k}) + d(fu, Tu) \\
&\quad \quad d(fx_{2k}, Tu)] + \gamma d(fx_{2k}, fu) H(Sx_{2k}, Tu) \\
&\leq [d(fu, fx_{2k+1})]^2 + 2d(fu, fx_{2k+1})d(fx_{2k+1}, Tu) \\
&\quad + \alpha[d(fx_{2k}, fx_{2k+1})d(fu, Tu) + d(fx_{2k}, Tu) d(fu, fx_{2k+1})] \\
&\quad + \beta[d(fx_{2k}, fx_{2k+1})d(fu, fx_{2k+1}) + d(fu, Tu) \\
&\quad \quad d(fx_{2k}, Tu)] + \nu d(fx_{2k}, fu) d(fx_{2k+1}, Tu).
\end{aligned}$$

Letting $k \rightarrow \infty$, we obtain

$$[d(fu, Tu)]^2 \leq \beta [d(fu, Tu)]^2$$

or

$$d(fu, Tu) \leq \sqrt{\beta} d(fu, Tu)$$

Hence $fu \in Tu$. Similarly,

$$\begin{aligned} [d(fu, Su)]^2 &\leq [d(fu, fx_{2k+2}) + d(fx_{2k+2}, Su)]^2 \\ &\leq [d(fu, fx_{2k+2}) + H(Tx_{2k+1}, Su)]^2 \\ &\leq \beta [d(fu, Su)]^2 \end{aligned}$$

Hence $fu \in Su$.
