RECEIVED : 25 December, 2020

The physico chemical characteristic of road side grown piper betle (L) plant parts and soil sample has been determined. High soil contents of toxic or total heavy metals have been observed in the proximity of road side grown as compared to plant grown piper betle (L) at 100 mL. distance away from road side. Likewise, level of total Nitrogen and phosphorous also showed variations in different plant samples depending upon the extent of automobile exhaust release along road side.

## **Introduction**

In the last 2-3 decades concern about human health hazards associated with heavy metals in soil and plant has considerably increased (Aziad *et al.*, 1984) (Zwart and Sloof, 1989). High soil contents of toxic total heavy metals have been observed along road side (Broad ford *et al.*, 1975; Rodrizuez and Rodriguez, 1982; Mehta and Barbate, 1991, Sarin 1996). Heavy metal contents in certain plants have been studied (Flemming and Parle, 1977). Similarly, the uptake of Nitrogen and Phosphorus in some crops has also been studied (Tondon 1982; Bhargava, 1995).

## **M**ATERIAL AND METHODS

### **Collection of Samples :**

In the month of June, 2015 and 2016 soil samples and piper betle (L) adult plant sample were collected from 3 sites on main NH ((5) between Cuttack-Bhubaneswar high way, viz. 20 mt., and 100 mt. distance away from the road side. Samples were collected in polythene containers and washed with 1 per cent Nitric Acid and deionized water to avoid absorption of

PCM0200116

heavy metals on the walls of the container and also to preserve the samples for subsequent analysis of total heavy metals, Nitrogen and Phosphorous distribution in various parts. Like wise, soil samples were also collected from the same farm land.

### **BIOCHEMICAL TECHNIQUES**

**Total Nitrogen**: For toal nitrogen estimation, digestion will be done according to Snell and Snell (1954) and later estimation of the digest will be done colorimetrically.

The estimation of digest will be done with Nessler's reagent of Koch and Mc. Meekin's formula Oser, (1965). Amount of nitrogen will be calculated by using a calibration curve.

**Total Phosphorus**: For total phosphorus, digestion will be done by modified Allens method (Allen, 1940) with metol reagent (Oser, 1965). The digest of total phosphorous will be studied at 525 nm. (Allen, 1940). The amount of phosphate will then he quantitatively determined by using a calibration curve.

**Total Heavy Metals**: For estimation of total heavy metals, dry samples are digested in a mixture of 60% perchloric acid and concentrated nitric acid and then it is heated to dryness. The dry residue in dissolved in ammonium citrate buffer. From this solution heavy metals can be extracted with the help of purified dithizone (Sandell, 1950). The quantities will be estimated with the help of standard and calibration curve based on the methods suggested by Sandell (1950).

### **R**ESULT AND DISCUSSION

Concentration of total heavy metals in the samples, collected from different distances alog road side, is shown in Table 1. Similarly, total Nitrogen and Phosphorous contents are also shown in Table 1. Amount of total heavy metals are found more in the soil and piper betle plant parts growing in the proximity of road side as compared to those growing at 100 mt. distance in heavy metals in road side crops is probably linked to the quantity of automobile exhaust pollutants or traffic density on the road sider

	Total Heavy Metals Level in									
Month of	Farm soil	Stem cover	Stem pith	Leaves	Juice	Total heavy				
study		µmg/plant	shoot			metal				
Plants grown at 20 mt. distance away from road side (Experimental site I)										
June	0.556	0.1394	0.056	0.063	0.0314	0.023				
Plants grown at 50 mt. distance away from road side (Experimental site II)										
June	0.385	0.0386	0.0445	0.0469	0.0305	0.266				
Plants grown at 100 mt. distance away from road side (Experimental site III)										
June	0.358	0.0318	0.0428	0.0404	0.0386	0.19924				

Table 1. Effect of automobile exhausts on the uptake and distribution of heavy metal (per plant) in road side piper betle (L)

Table 2 shows that Nitrogen and Phosphorus uptake and distribution in the piper betle plant parts of road side crop. Levels of both Nitrogen and Phosphorus do not show much variations in the samples collected from different distances away from road side. However, there is some decline in both these parameters from proximity to more distances away from road side. However, there is some decline in both these parameters from proximity to more distances away from road side.
